Dept. of Transportation, Federal Aviation Administration, Office of Aviation Research, 2005 OCLC Number: (OCoLC)62102148 Subject: Adhesive joints -- Testing. Excerpt: . . . 3. ANALYSIS APPROACHES AND CASE STUDIES. 3. 1 STRESS DISTRIBUTION IN DOUBLE LAP JOINT CONFIGURATION. 3. 1. 1 Volkersen. Volkersen 1 first proposed a simple shear lag model for load transfer from one adherend to another by a simple shearing mechanism alone. In the model, the adherends are assumed in tension and the adhesive is in shear only, and both are constant across the thickness. The important relationships are given by $E t^2 E t P \cosh(x) \sinh(x) i i o o (3-1) (x)^4 \sinh(c) E t^2 E t \cosh(c) i i o o$ where $G 1 2 2 a () t E t E t a o o i i$ In these expressions, the subscripts o, i, and a denote the respective components relative to the outer adherend, inner adherend, and adhesive. The parameter P denotes the loading applied at the end of the inner adherend, and the parameter c is half the length of the adhesive. The origin of the x coordinate is in the middle of the adhesive, see figure 3-1. However, the Volkersen solution does not reflect the effect of the adherend bending and shear deformations, which are potentially significant for composite adherends with a low shear and transverse moduli and strength. The TOM solution 6 provided a correction to the shear lag model with the assumption that the shear stress is linear through the adherends. As a result, the 2 is replaced by...
