Excerpt: . . . the anthers lie in such a position that they can transfer the pollen on to it; the pea flower tribe are favourites with them, and also the Composit. All this section have long tongues so that they are able to reach the nectaries of 67 Fig. 8. Fig. 9. plants with long tubular flowers. In visiting these the pollen is often deposited on the back of the bee; this it is able to transfer to its under side by means of the brushes on its feet or tarsi. The arrangements of the humble bees for pollen gathering are altogether different from those mentioned above. They have the hind shin outwardly shining and rather concave, with a series of long curved hairs running down each side of it and partly curving over it, so that they carry their mass of pollen in a sort of basket, scientifically called the corbicula (fig. 9); this would be impossible if the pollen were gathered dry, as it is by most of the solitary bees, so the bee moistens it on the...
